New product introduction:

The self-tapping composite screw stud that blends in any design: CAF-COMPO

Press release, September 2017

Imagine a screw stud on deck of your beautiful boat used to fix a cover being 100% corrosion free and that blends away in the deck color. A final farewell to those annoying eye-catching points that stand out of the smooth design lines, even if they are not corroded. Designers love to have the beautiful lines and shapes of their product not being disrupted by those inevitable points to hold cushions, blinds, carpets or covers down on deck. While it entails the exact same and quick installation as a normal screw stud. A unique formula of smart design and high quality materials make it possible to have a composite self-tapping screw stud for use in fiber glass, wood and other composites.

CAF-COMPO screw-stud: enabling marine fabricators and boat builders to have their products really stand off from the crowd.

CAF-compo screw-stud is a composite self-tapping screw stud for use in fiber glass, wood and other composites. The stud is the lower part of a snap or ring-spring press fastener system. The stud will fit any regular ring spring socket, no matter the material nor supplier. It comes in a few white variants to match deck colour of yachts, light grey and black, or any custom colour you like. And finally, no issue with corrosion or wearing out. A version with a metric thread makes it possible to solve the corrosion issue on any aluminum surface, like window-frames.

Until now, it was considered not possible to have a composite screw tap its way into a hard surface like polyester.

It is good to know that the features of this product idea are on top of any boat builders' wish list for quite some time. The product development is initiated by concrete and specific market needs; as technology was not met up for a thermoplastic to self-tap into a thermosetting material like fiber-glass. We are happy to see that enthusiasm being confirmed by some upfront orders and investments from clients. A smart design of a.o. the tapping thread combined with one of the hardest material available makes it possible. Initially it is designed to fix fabric, like covers, cushions and blinds, on boats. The applications are numerous if you realize that developments of composites are only to enhance resistance to outdoor conditions, without compromising convenience or basic functionality.

The stud fits any ring-spring socket available in the market and is positively tested to hold 500N shear force. It is UV-stabilized and even a strong blow of a hammer on the back will not have the stud to pop out of the surface.
